# Demo: Monitor Your Live Agent

# Planning Agent Updates

**Ad-hoc updates are risky –  
they are time consuming,  
prone to human error and  
we run the risk of deploying  
untested or broken code.**

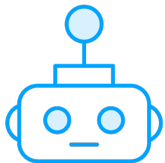

# Best Practices for Agent Updates

**Version control – track all code, Dockerfile, and config changes**

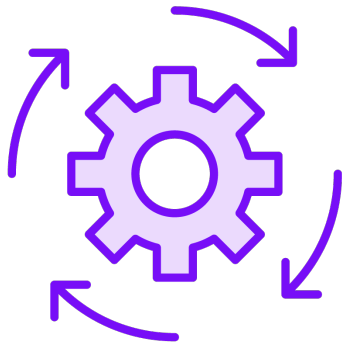

**Thorough testing – test changes locally and if possible, in a staging environment**

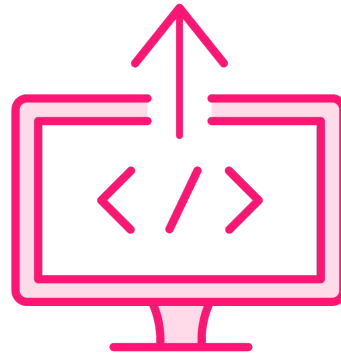

**Automation (CI/CD) – automate the build, test, and deployment process**

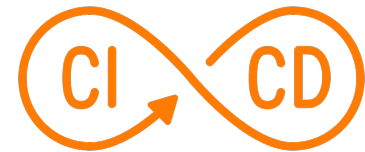

# Introducing CI/CD Principles

**Continuous  
integration**

**Continuous  
deployment**

**It transformed how we  
manage updates**

# Demo: Build Your CI/CD Update Pipeline

# Goal of Our Update Pipeline

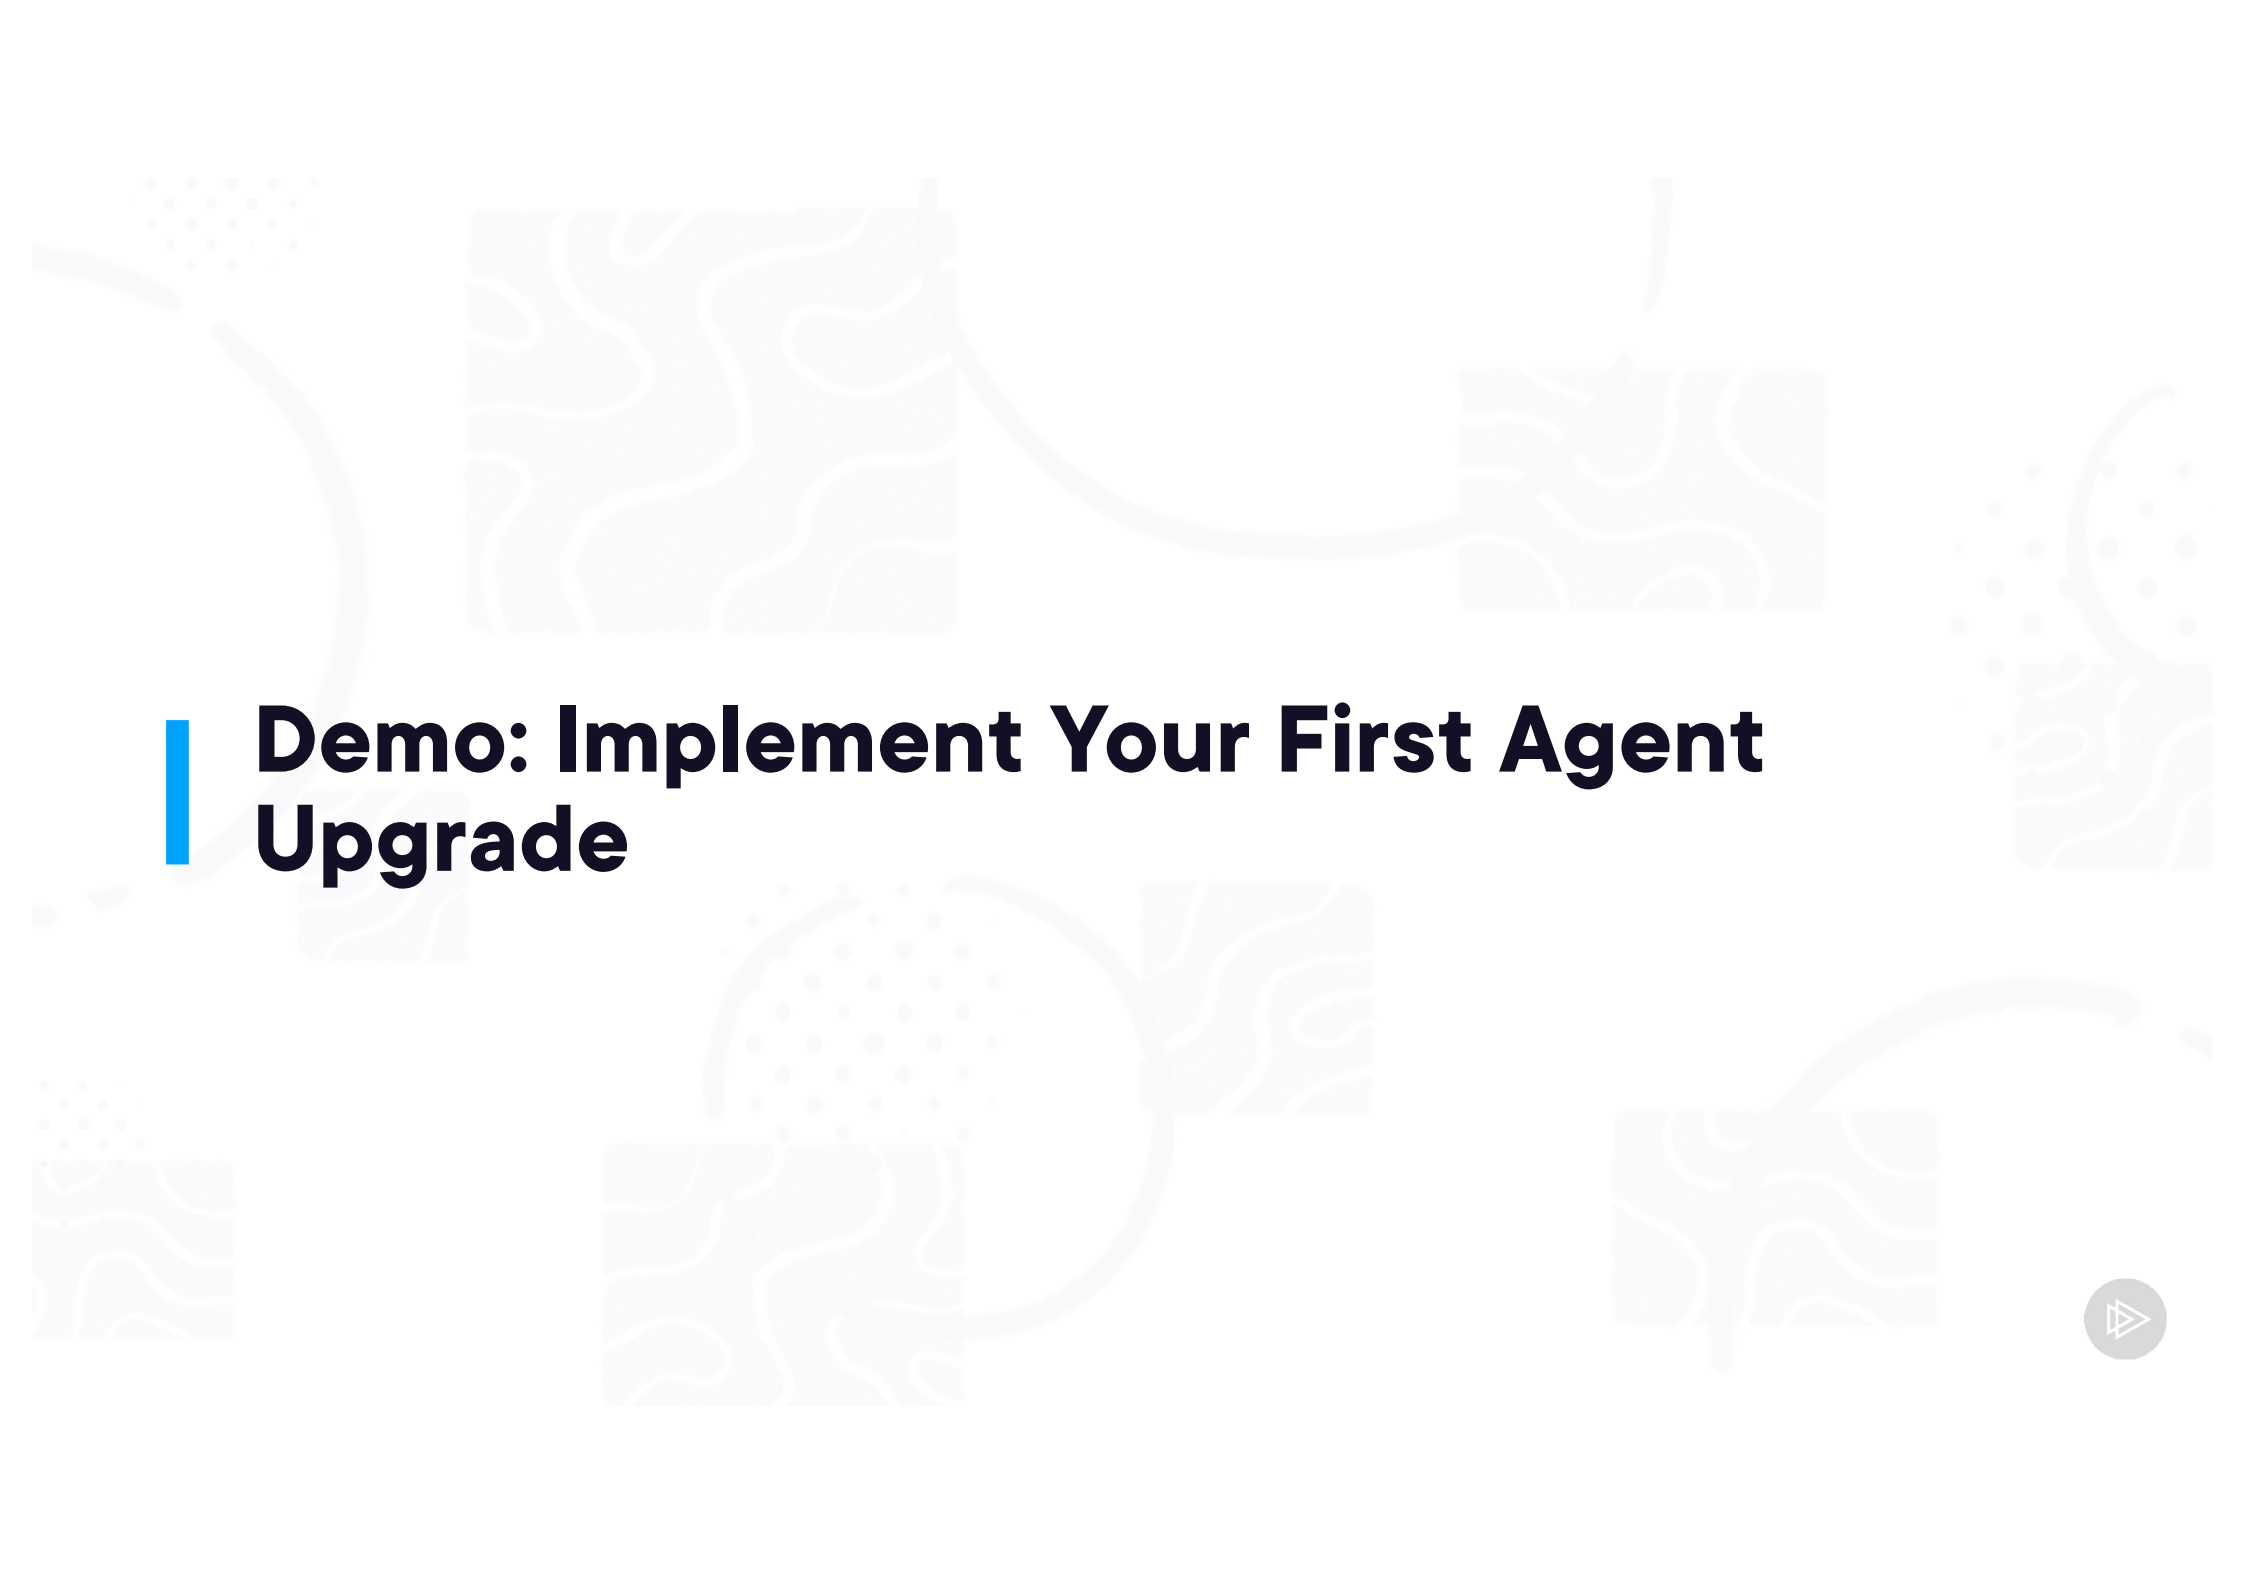

If a code change for the agent is pushed to our Git repo, we want:

- Google Cloud Build to pick it up
- Rebuild our Docker image
- Push it to Artifact Registry
- Deploy the new version to Cloud Run

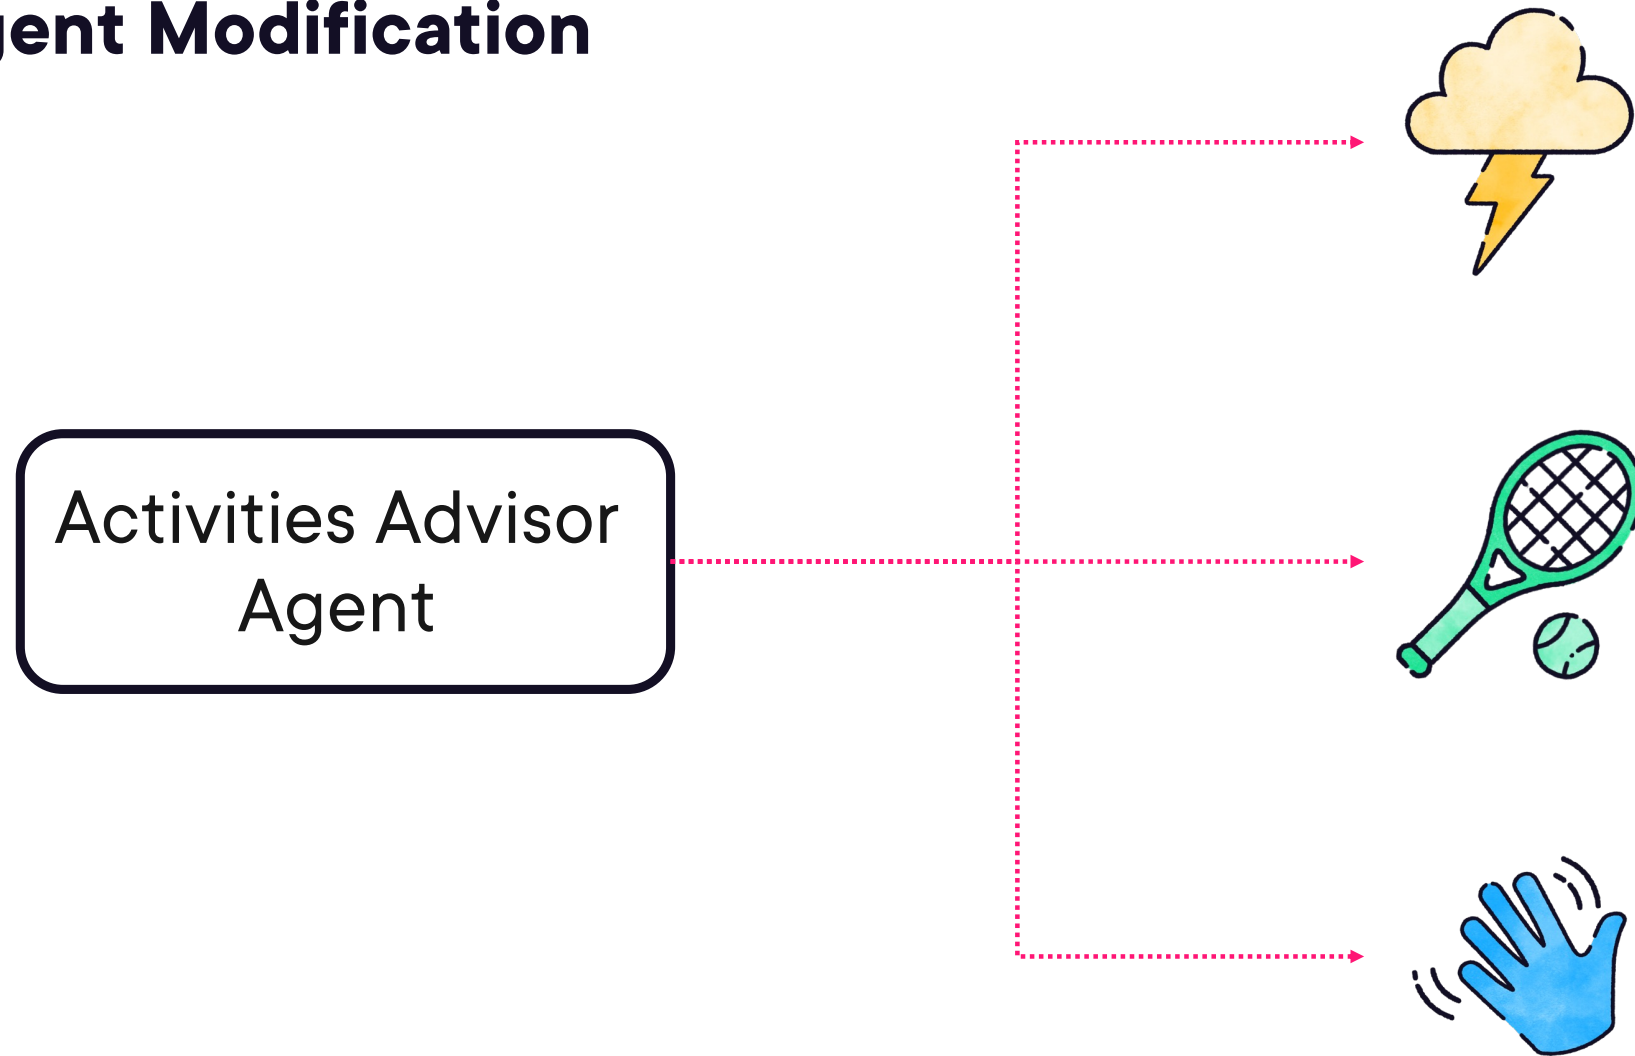

# Demo: Implement Your First Agent Upgrade

# Agent Modification

**Congratulations!**

# Thank you for your time!
